Abstract— Currently, supermarket run-centres, Big Marts keep track of each individual item's sales data in order to anticipate potential consumer demand and update inventory management. Anomalies and general trends are often discovered by mining the data warehouse's data store. For retailers like Big Mart, the resulting data can be used to forecast future sales volume using various machine learning techniques like big mart. A predictive model was developed using Xgboost, Linear regression, Polynomial regression, and Ridge regression techniques for forecasting the sales of a business such as Big -Mart, and it was discovered that the model outperforms existing models.

Keywords—Linear Regression, Polynomial Regression, Ridge Regression, Xgboost Regression

# I. INTRODUCTION

Everyday competitiveness between various shopping centres as and as huge marts is becoming higher intense, violent just because of the quick development of global malls also online shopping. Each market seeks to offer personalized and limited-time deals to attract many clients relying on period of time, so that each item's volume of sales may be estimated for the organization's stock control, transportation and logistical services. The current machine learning algorithm is very advanced and provides methods for predicting or forecasting sales any kind of organization, extremely beneficial to overcome low – priced used for prediction. Always better prediction is helpful, both in developing and improving marketing strategies for the marketplace, which is also particularly helpful

## II. RELEATED WORK

A great deal of work having been gotten really intended to date the territory of deals foreseeing. A concise audit of the important work in the field of big\_mart deals is depicted in this part. Numerous other

Measurable methodologies, for example, regression, (ARIMA) Auto-Regressive Integrated Moving Average, (ARMA) Auto-Regressive Moving Average, have been utilized to develop a few deals forecast standards. Be that as it may, deals anticipating is a refined issue and is influenced by both outer and inside factors, and there are two significant detriments to the measurable technique as set out in A. S. Weigend et A mixture occasional quantum relapse approach and (ARIMA) Auto-Regressive Integrated Average way to deal with every day food deals anticipating were recommend by N. S. Arunraj and furthermore found that the exhibition of the individual model was moderately lower than that of the crossover

E. Hadavandi utilized the incorporation of "Genetic Fuzzy Systems (GFS)" and information gathering to conjecture the deals of the printed circuit board. In their paper, K-means bunching delivered K groups of all information records. At that point, all bunches were taken care of into autonomous with a data set tuning and rule-based extraction ability. Perceived work in the field of deals gauging was done by P.A. Castillo, Sales estimating of new distributed books was done in a publication market the executives setting utilizing techniques. "Artificial computational organizations" are additionally utilized nearby income estimating. Fluffy Neural Networks have been created with the objective of improving prescient effectiveness, and the Radial "Base Function Neural Network (RBFN)" is required to have an incredible potential for anticipating deals.

**Dataset:** collected the dataset form the internet for the website called kaggle.com. In this work all having test dataset and train dataset in the test data set having a 5000 dataset and in the train data having a 8000 data

set. Fig1shows the train data and Fig2 shows the sample of test dataset.

TABLE 1: Attributes Information

| Attribute        | Description  |
|------------------|--|
| Item_Identifer   | It is the unique product Id number.  |
| Item Weight      | It will include the product's weight.  |
| Item_Fat_Content | It will mean whether the item is low in fat or not.  |
| Item -Visibility | The percentage of the overall viewing area assigned to the particular item from all items in the shop. |
| Item -Type       | To which group does the commodity belong   |
| Item-MRP         | The product's price list   |

| Outlet-Identifier | a distinct slot number                         |
|-------------------|--|
| Outlet-           | The year that the shop first opened its doors. |
| Establishment     |  |
| Year              |  |
| Outlet-Size       | The sum of total area occupied by a            |
|                   | supermarket.                                   |
| Outlet-Location   | The kind of town where the store is situated.  |
| Outlet-Type       | The shop is merely a supermarket or a          |
|                   | grocery store.                                 |
| Item-Outlet-Sales | The item's sales in the original shop          |
|                   |  |

#### Train data set

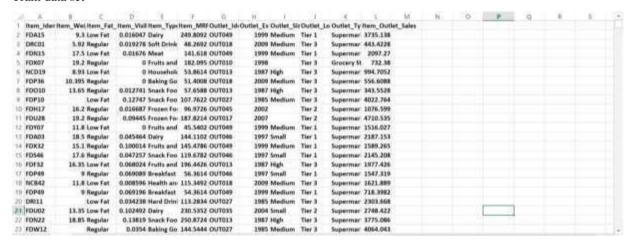

Fig1: Shows the sample of train data

## Test dataset

Fig2: Shows the sample of test data

#### III. METHODOLOGY

Fig3 shows the architecture Diagram of the proposed model where they focus on the different algorithm application to the dataset. Where we are calculating the

Accuracy, MAE, MSE, RMSE and final concluding the best yield algorithm. Here are the following Algorithm are used.

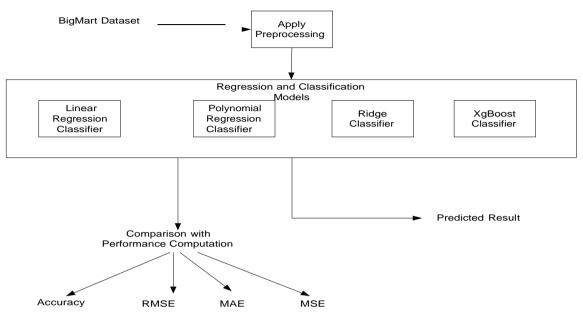

Fig3: Shows the proposed Architecture Diagram

# A. Linear Regression

- Build a fragmented plot.1) a linear or non-linear pattern of data and 2) a variance (outliers). Consider a transformation if the marking isn't linear. If this is the case, outsiders, it can suggest only eliminating them if there is a non-statistical justification.
- Link the data to the least squares line and confirm the model assumptions using the residual plot (for the constant standard deviation the assumption) and normal probability plot (for the normal probability assumption) A transformation might be necessary if the assumptions made do not appear to be met.

- If required, convert the data to theleast square using the transformed data, construct a regression line.
- If a change has been completed, return to the previous process 1. If not, continue to phase 5.
- When a "good-fit" classic is defined, write the least-square regression line equation. Consist of normal estimation, estimation, and Rsquared errors.

Linear regression formulas look like this:

$$Y = o_1x_1 + o_2x_2 + \dots o_nx_n$$

*R-Square*: Defines the difference in X (depending variable) explains the total variance in Y (dependent variable) (independent variable). This can be expressed mathematically as

$$R - Square = 1 - \frac{\sum (Y_{actual} - Y_{predicted})^2}{\sum (Y_{actual} - Y_{mean})^2}$$

## B. Polynomial Regression Algorithm

- Polynomial Regression is a relapse calculation that modules the relationship here among dependent(y) and the autonomous variable(x) in light of the fact that as most extreme limit polynomial. The condition for polynomial relapse is given beneath: y= b<sub>0</sub>+b<sub>1</sub>x<sub>1</sub>+ b<sub>2</sub>x<sub>1</sub><sup>2</sup>+ b<sub>2</sub>x<sub>1</sub><sup>3</sup>+. b x n 1
- It is regularly alluded to as the exceptional instance of various straight relapse in ML. Since we apply some polynomial terms to the numerous straight relapse condition to change it to polynomial relapse adjustment to improve accuracy.
- The informational collection utilized for preparing in polynomial relapse is of a non-straight nature.
- It uses a linear regression model to fit complex and non-linear functions and datasets.

# C. Ridge Regression

Ridge regression is a model tuning tool used to evaluate any data that suffers from multicollinearity. This method performs the L2 regularization procedure. When multicollinearity issues arise, the least squares are unbiased and the variances are high, resulting in the expected values being far removed from the actual values.

The cost function for ridge regression:

$$Min(||Y - X(theta)||^2 + \lambda ||theta||^2)$$

# D. XGBoost Regression

"Extreme Gradient Boosting" is same but much more effective to the gradient boosting system. It has both a linear model solver and a tree algorithm. Which permits "xgboost" in any event multiple times quicker than current slope boosting executions. It underpins various target capacities, including relapse, order and rating. As "xgboost" is extremely high in prescient force however generally delayed with organization, it is appropriate for some rivalries. It likewise has extra usefulness for cross-approval and finding significant factors.

#### IV. RESULT AND DISCUSSION

#### Liner Regression

TABLE 2: Shows the linear regression result on the various parameter

| Parameter | value       |
|-----------|-------------|
| Accuracy  | 48.57       |
| MSE       | 1644387.708 |
| MAE       | 989.707     |
| RMSE      | 1282.336    |

# Polynomial regression

TABLE 3: Shows the polynomial regression result on the various parameter

| Parameter | value       |
|-----------|-------------|
| Accuracy  | 50.52       |
| MSE       | 1565732.673 |
| MAE       | 893.604     |
| RMSE      | 1251.293    |

## Ridge regression

TABLE 4: Shows the Ridge regression result on the various parameter

| Parameter | value       |
|-----------|-------------|
| Accuracy  | 49.57       |
| MSE       | 1684660.961 |
| MAE       | 987.27      |
| RMSE      | 1297.945    |

## XgBoost Regression

TABLE 5: Shows the Xgboost regression result on the various parameter

| Parameter | value       |
|-----------|-------------|
| Accuracy  | 58.74       |
| MSE       | 1373525.447 |
| MAE       | 874.562     |
| RMSE      | 1171.974    |

#### Frequency of item\_fat\_content

TABLE 6: Shows the Xgboost regression frequency of item fat content

| Parameter | value |
|-----------|-------|
| Low Fat   | 5089  |
| Regular   | 2889  |
| LF        | 316   |
| reg       | 117   |

TABLE 7: Comparison of Accuracy with the Model

| Model                | Accuracy |
|----------------------|----------|
| Linear Regression    | 48.6     |
| PolynomialRegression | 52.8     |
| Ridge Regression     | 42.5     |
| Xgboost Regression   | 63.9     |

## V. CONCLUSION

In this work, the effectiveness of various algorithms on the data on revenue and review of, best performance-algorithm, here propose a software to using regression approach for predicting the sales centered on sales data from the past the accuracy of linear regression prediction can be enhanced with this method, polynomial regression, Ridge regression, and Xgboost regression can be determined. So, we can conclude ridge and Xgboost regression gives the better prediction with respect to Accuracy, MAE and RMSE than the Linear and polynomial regression approaches. In future, the forecasting sales and building a sales plan can help to avoid unforeseen cash flow and manage production, staff and financing needs effectively. In future work we can also consider with the ARIMA model which shows the time series graph.
